Backend and platform engineer (BS Computer Science, UT Dallas, Aug 2025). I build and run a self-hosted fleet of 7 servers, 40 VMs and 3 Kubernetes clusters with 109 alert signals, and I write every failure up to root cause. Looking for a junior SRE, DevOps, cloud or backend role.

Skills

- **Languages:** Python, Go, SQL, Bash; working Java, C, TypeScript.
- **Infrastructure:** Kubernetes (RKE2), Flux GitOps, Kyverno, Docker, Terraform, AWS (VPC, IAM OIDC), VMware ESXi, Linux, Cloudflare Tunnels.
- **Reliability:** VictoriaMetrics, Prometheus, Grafana, alert design, incident response, root-cause analysis, restore-tested backups, internal PKI.
- **Backend and CI:** PostgreSQL, Redis, FastAPI, Celery, REST APIs; GitHub Actions and Forgejo CI with branch protection.

Projects

Platform and Reliability Engineering, self-hosted fleet **eramirez.dev**
Kubernetes, Flux, VictoriaMetrics, Grafana, PostgreSQL, Python *2024 - present*

- Operate 3 Kubernetes clusters (15 nodes) under Flux GitOps with a signed-image admission gate; 77 scrape targets feed 23.6M rows/hr into VictoriaMetrics; 109 alert signals, each with an owner.
- A job failed 970 times in 4 days with one alert. Moved the watchdog outside the scheduler it watched, then added output signals after a pipeline reported green for 5 days while producing nothing.
- Split a queue-depth alert that was red in 369 of 816 runs (45%) into an incident signal and a human nudge, so a page always means something is broken.
- Run an internal CA issuing 24-hour certificates for 4 services; caught a silent renewal failure 6h52m before expiry. Backups are restore-tested (9,849 rows read back); 0 inbound ports.

Durable Postgres Task Queue **github.com/BetV3/orch-queue**
Python, PostgreSQL, MCP *2026*

- Workers claim with `FOR UPDATE SKIP LOCKED`, hold leases renewed by heartbeat, and a reaper requeues dead work. Found a reaper bug where `NULL < now()` hid orphaned tasks; fixed and tested both ways.
- Runs 7 workloads (168 tasks), including a job-application pipeline where a human approves every submit: 59 applications sent, 0 without a human decision.

CheckPulse, multi-region uptime monitoring **github.com/BetV3/UptimeBot**
Python, FastAPI, PostgreSQL, Redis, Celery *2026*

- Live SaaS: checks from 3 regions, a monitor is marked down only when 2 of 3 agree; alerts to Slack, Discord, Telegram, email and webhooks; per-client status pages; 7 containers in 1.9 GB.

AWS Infrastructure Pipeline **github.com/BetV3/cloud-infrastructure-pipeline**
Terraform, AWS, GitHub Actions *2026*

- VPC module with flow logs, remote state backend, and a GitHub OIDC deploy role (no static keys); plan on pull request, apply on merge.

Payments Ledger API **github.com/BetV3/Payments-Ledge-API**
Python, FastAPI, PostgreSQL, Redis *2026*

- Double-entry ledger with idempotency keys so a retried request cannot post a payment twice; tested service and API layers.

Distributed Log Analyzer **github.com/BetV3/Distributed-Multithreaded-Log-Analyzer**
Go, goroutines, worker pools *2025*

- Parses a 3.3 GB, 10M-line log in 6 s with 8 to 11 workers versus 36 s on one; measured to find where adding workers stops helping.

Experience

Walmart **Plano, TX**
Loader (Personal Shopper until Oct 2026) *Jul 2023 - Present*

- Worked through my CS degree; fulfilled 80+ customer orders per shift with under 1% substitution errors and met same-day deadlines.

Education

University of Texas at Dallas **Richardson, TX**
BS, Computer Science *Jan 2024 - Aug 2025*
Languages: English and Spanish (bilingual)
